PROVIDING HOST INFORMATION TO DEVICES

IN MULTI SCSI TRANSPORT PROTOCOLS

ABSTRACT OF THE DISCLOSURE

Systems, methods, and data structures are provided for identifying host information at a physical layer of an information handling system. The method includes issuing a command from a host computer and sending a host information command to a device. The command may be issued in a first transport protocol. The host information command may include a host identifier identifying the host that issued the command and a tag identifying a reissued command, the reissued command including the command reissued in a second transport protocol.
